Abstract² The purpose of this research is to examine the risk-adjusted investment performance of three versions of the µ'RJV RI WKRHU 'µR'Zs¶¶stegies, relative to that of the broader Dow Jones Industrial Average (DJIA) Specifically, the research explores the traditional DOD portfolio (Dow-10), the DQG WKH µ6PDOO 'R(Shnvall Rologs)WAKnH Dowempirical analysis utilizing the Sharpe ratio is used to investigate the relative investment performance of the DOD variants. Over the period 19962016, the three DOD portfolios outperform the DJIA, in terms of, raw annual returns, total sample period returns, risk-adjusted annual returns, risk-adjusted rolling period returns and Sharpe ratios. The study concludes that the DOD strategies provide superior risk-adjusted returns than the DJIA Index and that the dividend-driven/contrarian methods may deliver enhanced returns, compared with the buy-and-hold of Dow-30 Index.

Index Terms² Dividend investing, dogs of the dow, investment performance, sharpe ratio.

I. INTRODUCTION

Michael O'Higgins and John Downes inetbook titled, ³ % H D W L Q J ´ [W] killustrate Zow an equally weighted portfolio of the top 10 highest dividend/ielding companie in the Dov Jones Industrial AverageJIA) outperforms the broader DJIA rarket index. This popular dividend-driven/contrarian investment approachkings wn as WKH µ'RJV R(DOMD KorHDoWR102) Strategy. The DOD strategy is intuitive and can beasely implemented by investors. The Dow-10 approach requires that an erstor build an equallyweighted portfolio of the 16tocks from the DJIA Index that pay the highest divide nield as of the end the portfolio for oneyear and rebalances the portfolioth the 10 highestyielding stocks in the DJIA in the following year. The procedure is repeated once a yeas the constituents of the Index changes.

Earlier work of 2 ¶ + LJJLQV DQ Gandersize gelH2V show that the DOD portfolioerforms significantly better in termsof overall btal rate of return that the DJIA Index. The findings generatgreatinterest in the investment community The findings shed additionallights on the benefits of and mainstream financial news media sucthasWall Street annual changes in the DOD portfolio and follow the that the DOD strategies provide superisk-adjusted returns

performance of thenivestment strategy.he media coverage of the DODstrategy suggests that this investment approis of high interest to both individual as well assitutional investors Moreover, there are mutual funds thatck the performance of the DOD strategy. rFoinstance, the ELEMENTS Dogs of the Dow High Yield Select 10 Exchangeraded fund (ticker: DOD), Hennessy Total Return Fund (HDOGX), Hennessy Balanced Fund (HBFBX) and Invesco Select 10 Industrial Portfol(iSDOW) are funds that attempt to capture the certs of the traditional DOD or Dow-10 portfolio.

The investment philosophy of the DOB consistent with blue-chip and valuestyle dividend-driven investing programs that focus on dividend persistence and sustainability The Dow Jones Industrial Average JIA) Market Index is an excellent choice for investors seeking µ V D Ihigh-dividend yielding investment opportunities. Stocks in the DJIA are well-established multinational firms that aremore likely to continue to palyigh level of dividends and can reover from company financial dstress and/or business cycle more easily than other large apitalization stocks due to the longerm track records of thespow companies

The chief objective of this paper is to determine whether the various forms of DOD treategy outperform (on a risk-adjusted basishe Dow Jones Industrial Avera@JIA). strategy generally yields higher returns but the results are not statistically significant.

where:

III. BACKGROUND AND HYPOTHESES

deliver superior investment return relative to buy-and-hold return of the Dow Jones Industrial Average (DJIA) market

index. Such investment approach is intuitive and easy since all of the DOD portfolios are equally-weighted, follow by investors Because the holding period of the DODportfolio returns are calculated using the annual individual method is a period of one year, the portfolio avoidstock returns and are expressed as follows:

short-term capital gains and hence the ordinary income.taxes Further, the DOD strategy requires portfolio rebalance only once per year, the transactions costs associated with such approach are considered trivial. Therefore, this researchere:

the DOD investment strategy. The empirical analysis compares the risk-return property of the DOD approaches R_i = the annual rate of return of the stock and the DJIA.

This study tests the following (null) hypotheses:

HO1: There is no difference in raw return performance of the three DOD strategies when compared with the With the portfolio returns, geometric return and arithmetic buy-and-hold return of DJIA market index.

return are calculated to compare the annualized rate of seturn HO2: There is no difference in risk-adjusted returgenerated by the DOD approaches. Geometric return and performance of the three DOD strategies when compared thmetic return are calculated as follows:

 $R_{i,t}$ = the annual rate of return of the stock D_i = the amount of cash dividend during the year

(1)

 $P_{i,t}$ = the price of the stockat the beginning of the year

The Dogs of the Dow strategy has long been proposed to $P_{i, t+1}$ = the price of the stockat the end of the year

 $R_{i,t} = [D_i / P_{i,t}] + [P_{i,t+1} - P_{i,t}] / P_{i,t}$

$R_p = R_i + R_j$ « R_n / S (2)

focuses on the risk-adjusted performance of the 3 variants of R_p = the annual rate of return of the portfolio R_i = the annual rate of return of the stock R_n = the annual rate of return of the stock S = the number of stocks in the portfolio

$$R_G = [1 + R_1] \times [1 + R_2 @ [k_1 + R_N]^{(1/N)} \pm 1$$

$$R_A = \begin{bmatrix} R_1 + R_2 & \ll & R_N \end{bmatrix} / N$$

where:

 R_G = the geometric rate of return of the portfolio

 R_A = the arithmetic rate of return of the portfolio

 R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the annual rate of return of the portfolio in the vertice R_N = the verti

N = the number of years in the sample period

In addition to the basic measures of portfolio return Arithmetic F analysis, this study employs the Sharpe ratio to determine theotal Return risk-adjusted performance of the DOD portfolios since the FV of \$10k size of the portfolios differ. This research analyzes the annua

Sharpe ratios of the DOD portfolios across the sample time_____ periods and over a five-year rolling windows for robustness

of results. Utilizing the 0 R U Q L Q J V W D U ¶ paperH W Koraccrupt for the riskiness of the portfolio, the Sharpe [15], the Sharpe ratio analysis begins with obtaining the to determines the rate of excess return (i.e., return over the monthly returns of the DOD portfolios and the correspondint sk-free rate) per unit of risk. Analyzing portfolio 30-day Treasury-bill returns. With the monthly data, monthly erformance with Sharpe ratio allows the comparison to portfolio Sharpe ratios are calculated and are expressed affect the true reward/return earned for the equivalent risk.  RF_i = rate of the return of the 30-day T-bill in month

V. EMPIRICAL RESULTS

2013 Table I presents the preliminary investment performance₀₁₂ of the three DOD portfolios. The raw return performance2011 analysis indicates that the Dow Jones Industrial Average010 (DJIA) market index trails all the three variants of DOD, in 2009 terms of geometric, arithmetic and total compounded rates Q_{007}^{2008} return. The geometric return (the accurate measures $\overline{g_{006}}$ annualized rate of return) of the DJIA is 6.23% over the2005 period 1996-2006, while those of the Dow-10, Dow-5 and 2004 6PDOO µ'RJV RI WKH 'RZ' DUH 2003 respectively. The total compounded rates of return of the $\frac{2002}{2001}$ portfolios also show the same results. The last line of Table $\overline{2}_{000}$ reports the total dollar value of the portfolio, assuming an1999 annual investment contributions of \$10,000. The value of the 998 annuities grows to \$410,451 during the period 1996-2016. 1997 1996

It is interesting to find that the portfolio consisting of the lowest priced stocks from the Dogs of the Dow portfolio (i.e.., the Small Dogs) outperformed all the other portfolios in

VXJJHVW D µULVN¶ RU µYRODWLOLW\¶
(3) step of the study analyzes the risk-adjusted performance of the portfolios. This paper employs the Sharpe ratio to analyze

(4) the investment performance since the results from raw return analysis may be driven by the underlying risk of the portfolios.

TABLE I: PORTFOLIO PERFORMANCE COMPARISON, 1996-2006 RAW

RETURNS							
Returns	DJIA	Dow 10	Dow 5	Small Dogs			
Geometric Return	6.23%	6.91%	7.13%	7.75%			
¹ Arithmetic Return	7.30%	8.06%	8.72%	9.47%			
heotal Return	355.6%	406.6%	425.0%	479.1%			
eFV of \$10k Ia∱ ^{nnuity}	\$410,451	\$443,854	\$455,598	\$489,428			

Table II presents the annualized Sharpe ratios of the three DOD portfolios and the DJIA. The Sharpe ratios in Table II are shown for each portfolio for each individual year from 1996 to 2016. The results indicate tthat DOD portfolios beats the DJIA strategies sixteen out of twenty-one times (or 76.2%) over 1996-2016 and during 2020-16 the DOD strategies outperforms the DJIA in fifteen of the seventeen years (or 88.2%). As for the DOD portfolios, the results appear to be more evenly distributed among Dow-10, **D**owand the Small Dogs of the Dow. Table II suggests that on a risk-adjusted basis, performance of the DOD strategies is better than that of the entire DJIA index. This research contends that the superior performance of the DOD approaches does not depend on the riskiness of the essederlying portfolio.
